WPI; 1997-065467/06.

Immunogenic type F botulinum toxin polypeptide(s) - allows recombinant vaccine prodn.

Claim 5; Page 19; 37pp; English.

Novel polypeptides (AAM09014-17) respectively comprise amino acids 848-1278, 848-991, 992-1135 and 1136-1278 in the heavy chain of a type F botulinum neurotoxin (BoNT/F). They lack the Lothain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, as fusion proteins, e.g. with maltose binding protein to facilitate purification. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                 KIIKLIRTSNSNNSLGQIIVMDSIGNNCTMNFQNNNGGNIGLLGFHSNNLVASSWYYNNI 120
                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of a type F botulinum neurcoxin (BONT/F), and can be produced using a synthetic gene (AAT48101) based on the natural gene sequence (AAT48100) for the heavy chain. The polypeptides and its fragments (see also AAW9015-17) lack the light chain and HN epitopes necessary for botulinum toxin activity and toxin internalisation. They are free of botulinum toxin, making them useful for vaccine produ. Recombinant polypeptides can be produced in transformed host calls, esp. as fusion proteins, e.g. with maltose binding protein to facilitate purification. ```
and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an transformed cells to produce peptide antigens useful for eliciting an which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of the combinant nucleic acids are advantageous since it eliminates the need
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G
New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 432;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a capacity chain and a 100 kDa light chain which remain linked by a capacity chain of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corganisms such as Escherichia coli or Pichia pastoris. The use of the recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain about into the neuronal cell, where the translocation domain is not a MN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.

infection and regularing nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating an neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for including prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct domprishing Corymebacterium diphtheriae diphtheria toxin translocation domain (Dip-HN domain) and botulinum type F neurotoxin from Clostridium botulinum. This sequence is used in the exemplification of the invention. (Updated on 23-OCT-2003 to standardise OS field)

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells, killing cells, promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders including mascle spasms such as Dlephorospam, torticolis and
                                                                                                                                                                                                                                                                                                                                                                                                                      hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DipT-HW domain), botulinum type F neurotoxin binding domain (BONT/F-HC) from Clostridium botulinum and thrombin linker peptide. This sequence is used in the exemplification of the invention

BoNT/F-Hc-DipT HN domain-factor Xa linker fusion construct. AAE35694 standard; protein; 657 AA. 17-JUN-2003 (first entry) AAE35694; 

Apoptosis; therapy; inflammatory mediator; intracellular trafficking; infection; Prion disease; Alzheimer' disease; hypersecretion disorder; muscle spasm; ODD9, Pronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; diphtheria toxin; BONT/F; translocation domain; HN domain; DipT; Hc; binding domain; botulinum type F neurotoxin

21-MAY-2002; 2002WO-GB002384 WO200296467-A2 05-DEC-2002 Chimeric

Corynebacterium diphtheriae. Clostridium botulinum. Unidentified.

24-MAY-2001; 2001GB-00012687.

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for medulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating prion disease, Alzheimer' disease and wide range of disorders in more constructions and incomparation and allocations and incomparation and incomparations and incomparations and incomparations and incomparations and incomparations and incomparations and incomparations and incomparations and incomparations and incomparations and incomparations are incomparations. hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheriat toxin translocation domain (DipT-HW domain). botulinum type F neurotoxin binding domain (BONT/F-HC) from Clostridium botulinum and factor Xa linker peptide. This sequence is used in the exemplification of the invention Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell. Example 12; Page 63-65; 130pp; English (MICR-) MICROBIOLOGICAL RES AUTHORITY. WPI; 2003-167247/16. Sequence 657 AA; Sutton JM,

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for delivering therapeutic colls including neurodespenzative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence or modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate compises bacterial Mn-superoxide dismutase (MnSOD), from Canjugate compisies absorbitus, linker that can be cleaved by factor Xa, translocation peptide from influenza virus and a neuronal cell-specific conjugate.
                                                                                                                                                                                                                                                                                           New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                 (MICR-) MICROBIOLOGICAL RES AUTHORITY.

AAE07890 standard; protein; 862 AA. (first entry) 01-NOV-2001 AAE07890; AAE07890 

Modified clostridial heavy chain-superoxide dismutase conjugate #2.

Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; superoxide dismutase; SOD; diphtheria neurotoxin; botulinum neurotoxin type F; BONT/F.

The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain carboty terminal half of heavy chain (HC) of a neurotoxin, designated as HC that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence conjudic clostridial heavy chain-superoxide dismutase conjudate. This conjugate comprises bacterial Mn-superoxide dismutase conjudate. This conjugate compliant, linker that can be cleaved by factor Xa, translocation domain from diphtheria neurotoxin and a neuronal cell. New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells. (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DipT-HW domain), botulinum type F neurotoxin binding domain (BoNT/F-HO) from Clostridium botulinum and factor Xa linker peptide and Yersinia pestis targetred effector protien YopT. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficients, for modulating expression of cell-surface markers and for trafficients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hypersecretion disorders such as chronic obstructive pulmonary disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 12; Page 110-114; 130pp; English

The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain (amino agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for delivering therapeutic CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with botulinum controcation controcation to the exemplification of
                                                                       New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                  Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; botulinum neurotoxin type F; BoNT/F.

                                                                                                                       120
The present sequence represents a construct of the invention, comprising a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease and motor neurone diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel composition, comprising superoxide dismutase linked by a cleavable linker to a neuronal cell targeting component useful for delivering superoxide dismutase to neuronal cells to treat ischemia.

                                                                                                 ò
                                  The present sequence represents a construct of the invention, comprising a mitochondrial leader sequence from human manganese superoxide dismutase (Mn-SOD), a Bacillus stearothermophilus Mn-SOD, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocates the linker is cleaved to release the SOD. The composition is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and

A48940

Dontoxilysin (EC 3.4.24.69) B precursor - Clostridium botulinum

N.Alternate names: botulinum neuvotoxin type B (BoNT/B)

C,Species: Clostridium botulinum

C,Species: Dec-1993 #sequence revision 18-Nov-1994 #text_change 09-Jul-2004

C,Accession: A48940; 88105; E31575; A82871; 801155; 808562; 807128; 808573; 808574

N'Alternate names: tetanus neurotoxin
C;Species: Clostridium tetani
C;Date: 31-Mar-1988 #sequence revision 31-Mar-1988 #text_change 09-Jul-2004
C;Accession: A25689; A25757; A25194; B25194; A60759; S69348; S09364
R;Eisel, U.; Jarausch, W.; Goretzki, K.; Henschen, A.; Engels, J.; Weller, U.; Hudel, EMBO J. 5, 2495-2502, 1986
A;Gene: bont/b
C;Function:
A;Description: catalyzes hydrolysis of a Gln-Phe peptide bond in synaptobrevin 2
A;Description: catalyzes hydrolysis of a Gln-Phe peptide bond in synaptobrevin 2
C;Superfamily: tetanus toxin
C;Keywords: hydrolase; metalloproteinase; neurotoxin; transmembrane protein; zinc
F;2-441/Product: bontoxilysin B light chain #status experimental cLGHT>

Clavage of members of the synaptobrevin/VAMP family by types D and F Biol. Chem. 269:12764-12772(1994).

The Dotulinal neurotoxins and tetanus toxin. T. FOWCTION: Botulinum foxin acts by inhibiting neurotransmitter release. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where I can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc. CATALYTIC ACTIVITY: Limited hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-S9 condopeptidase that catalyzes the hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevine, SNAP25 or syntaxin. No condopeptidase that catalyzes the hydrolysis of condopeptidase that catalyzes the hydrolysis of proteins of the heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel community that the N- and C-terminal of the heavy chain mediate channel community. The submitment of a light chain mediate channel community that the N- and C-terminal of the heavy chain (H). The Light chain mediate channel community that the N- and C-terminal of the heavy chain (H). The Light chain mediate channel co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "Proteolygis of SNAP-25 by types E and A botulinal neurotoxins.";
J. Biol. Chem. 269:1617-1620(1994).
-!- FUNCTION: Botulinum toxin acts by inhibiting neurotransmitter release. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsyraptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc endopeptiadae that catalyzes the hydrolysis of the 180-Arg-|-Ile-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          181 bond in SNAP-25.
CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates to syntaxin. No COPACTOR: Binds 1 zinc ion per subunit (By similarity).
SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N and C-terminal of the heavy chain mediate channel formation and toxin binding, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE-94124495; PubMed-8294407;

SIMILARITY: Belongs to the peptidase M27 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PRINTS; PRO0766; BONTOXILYSIN.

and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc
                                                                          endopeptidase.
-!-CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevius, SNAP25 or syntaxin. No detected action on small molecule substrates.
-!-COFACTOR: Binds 1 zinc ion per subunit (By similarity)
-!-SUBRUIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel formation and toxin binding, respectively.
-!-SUBCELLULAR LOCATION: Serreted.
-!-MISCELLANBOUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, E, F, and G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        7 RLYTGVEVIIRK--NGSTDISNTDNFVRKNDLAYIN-VVDRDVEYRLYADISIAKPEKII

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Furict. Biol. 5:898-902(1998).
FUNCTION: Inhibits acetylcholine release. The botulinum toxin binds with high affinity to peripheral neuronal presynaptic binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-din-[-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   heavy chain (H).

Int. J. Syst. Daterriol. 46:1105-112(1996).

The C-terminum toxin to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminum of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln-[-Ag-198 bond in SNRP-25, thereby blocking results in Haccid paralysis, with frequent heart or respiratory failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This Swiss-Prot entry is copyright. ; Patent No. 5919665
; GENERAL INFORMATION:
APPLICANT: WILLIAMS, JAMES A.
TITLE OF INVENTION: VACCINE FOR CLOSTRIDIUM BOTULINUM
TITLE OF INVENTION: NEUROTOXIN
NUMBER OF SEQUENCES: 30
CORRESPONDENCE ADDRESS:
ADDRESSEE: MEDLEN & CARROLL, LLP
STREET: 220 MONTGOMERY STREET, SUITE 2200
CITY: SAN FRANCISCO
STATE: CALIFORNIA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels

Patent No. 686126
GENERAL INFORMATION:
PAPLICANT: Moll, Gert N.
APPLICANT: Moll, Gert N.
APPLICANT: Leenhouts, Cornelis J.
TITLE OF INVENTION: Export and modification of (poly) peptide in the lantiblotic way
TITLE REFERENCE: 2183-6573
CURRENT APPLICATION NUMBER: US/10/360,101
CURRENT FILING DATE: 2003-02-07
PRIOR FILING DATE: 2002-05-24
NUMBER OF SEQ ID NOS: 309
SOFTWARE: PatentIn version 3.1
